CIPACE

As an integrated Web-based system, CIPAce provides portfolio, capital project, and construction management capabilities for public and private owners. The technology allows owners to manage projects, costs, funding, schedules, resources, documents, bids, contracts, purchase orders, and invoices. With the built-in analytical module, owners can create reports. This type of feature is ideal for owners that need to get a realtime look at a project. The product also allows owners to create ‘what if’ scenarios for schedules, project ranking, and funding analysis for planning. The product’s Dynamic Form and Workflow Engine technologies enable users to design customizable interfaces and rules to support processes. Additionally, the product has a built-in Web application programming interface. This means CIPAce can integrate with third-party applications for financial, GIS (geographic information system), project management, and document management software.
